

7. Command and Control

Platforms used

- Kali VM
- Windows VM
 - Also suggest WinRAR installed
- Topics
 - Steganography
 - Command and Control using Metasploit

Early finish – quiz at labs today and tomorrow

What is C2?

- Command and Control (C2) is defined by MITRE as follows:

“Command and Control consists of techniques that adversaries may use to **communicate** with systems under their control within a victim network.

Adversaries commonly attempt to mimic normal, expected traffic to **avoid detection**. There are many ways an adversary can establish command and control with various levels of **stealth** depending on the victim’s network structure and defenses.”

- MITRE Corp.

- The main goal of C2 is to communicate and avoid detection through stealth communication.
- Naturally, the goal of the defender is to detect and mitigate the attack.

How would you achieve
“Stealth”?

C2 (stealth) communication

1. Static IP

- But very easy to detect and counter.

2. DNS

- Fixed number of domain names, which could be detected easily also.

3. Domain Generation Algorithms (DGA)

- Much larger search space, like finding a needle in a haystack.
- However, anomaly detection could detect unusual connection activities.
- Multiple domain names could be live at any one time.
- The algorithm can be reverse engineered.

4. P2P

- Harder to trace the route and connection points.

5. Common Cloud Services

- Seems like a normal traffic as the C2 server is hosted on the public cloud.

Encrypted channels

P2P

- Infected hosts form p2p nodes, assist in distributing commands and data
- Real-world examples
 - Storm Worm (2007): Used a P2P overlay for C2.
 - Conficker.C: Used P2P to propagate updates.
 - Gameover Zeus: A notable P2P botnet, highly resilient to takedowns.

C2 (stealth) communication

6. Steganography

- Hide information in plain sight.
 - Protocol Headers
 - Metadata
- Configurations could be in images, audio, video, etc.
 - LSB – least significant bit
 - LSB of each pixel (or video/audio equivalent) often can be altered with no visible change
- Steg could be combined with cryptography for added obfuscation.
- Attackers will use layered evasions.
 - Embedded content (encoding, compression etc.)
 - HTTP (chunking, zip, encoding etc.)
 - SSL encryption
 - TCP segment overlaps
 - Deliberately overlap TCP segments to encode data in the “conflicting” bytes.
 - Exploits how TCP reassembly works to smuggle hidden information
 - IP fragmentation
- Multiples, or all, could be used at once.

Steganography

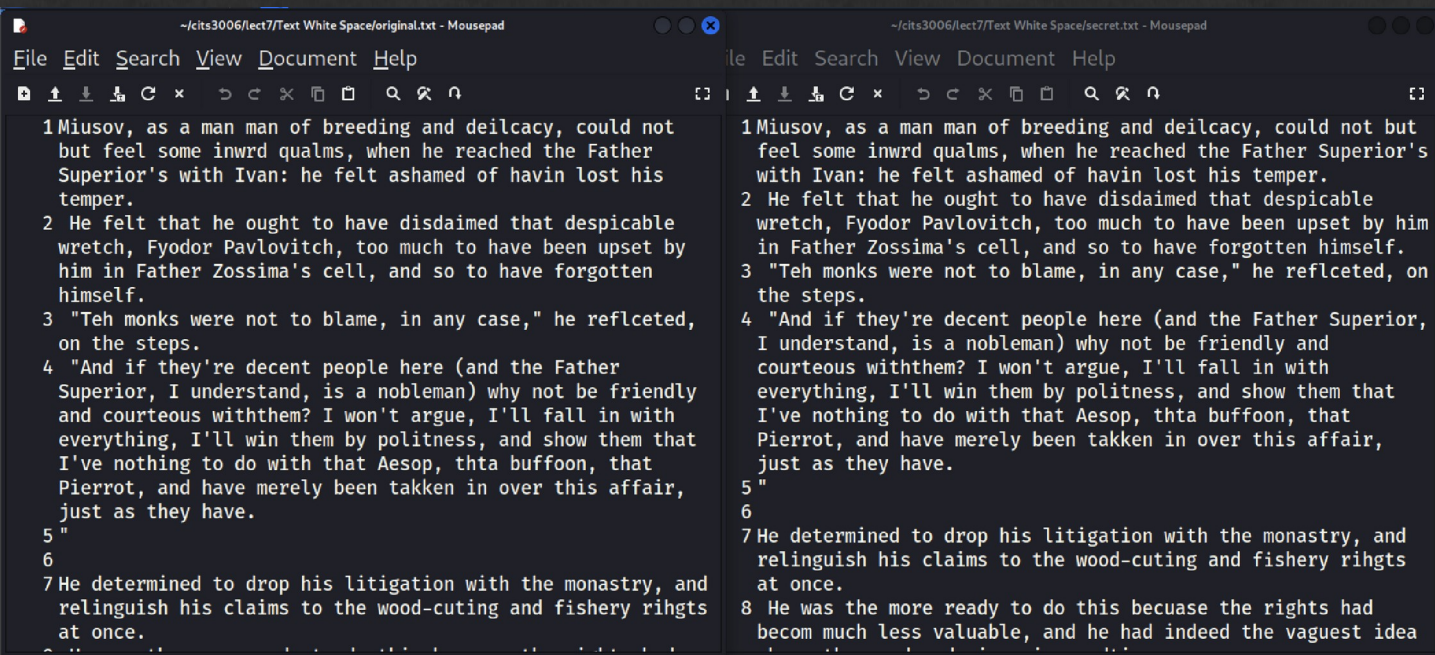

- Example code available for use in Kali
 - Need the Python Pillow library, but it should be installed by default.
 - If not, `python3 -m pip install pillow`

wget <https://github.com/uwacyber/cits3006/raw/2025s2/cits3006-labs/files/steg.zip>

Steganography

- White space steg

```
(base) └─(jin@kali)-[~/cits3006/lect7/Text White Space]
└─$ python3 decode.py
What is the hidden file name : secret.txt
your secret message is: hello world

(base) └─(jin@kali)-[~/cits3006/lect7/Text White Space]
└─$ python3 decode.py
What is the hidden file name : original.txt
no secret message in this file
```

Steganography

- LSB

```
(base) └─(jin@kali)-[~/cits3006/lect7/LSB]
└─$ python3 LSBencoder.py
What is the image file to be used?: space.png
What is the secret image file name? (extension must be png): secret.png
What is the secret message?: hello world
Loaded image
New image created.
Stored pixels to new image.
Image saved.
```

```
(base) └─(jin@kali)-[~/cits3006/lect7/LSB]
└─$
```

```
(base) └─(jin@kali)-[~/cits3006/lect7/LSB]
└─$ python3 LSBdecoder.py
What is the secret image file to unpack?: secret.png
Loaded image.
Extracting LSB from pixels...
hello world
```

```
(base) └─(jin@kali)-[~/cits3006/lect7/LSB]
└─$ python3 LSBdecoder.py
What is the secret image file to unpack?: space.png
Loaded image.
Extracting LSB from pixels...

```

What about defences?

- Various defence mechanisms exist:
 - Endpoints
 - Anti-malware
 - App controls
 - Security updates
 - Emails
 - Anti-spam/phishing/impersonation filtering
 - DNS
 - DNS filtering
 - Browser protection
 - Humans
 - Training
- However, these defence mechanisms are generally predicated on external attackers
 - C2 activities happens from inside the network!
 - The attack happens over a long period of time.
- Hence, we still need to monitor our *internal* network for malicious activities.

(Threat) Hunting Maturity Model

- HMM is a five-level evaluation system to categorise the organisation's ability to hunt threats.
- Created by David J Bianco (refs at end)
- Focuses on:
 - Data collection
 - Hypotheses Creation
 - Tools and Techniques
 - Pattern and Tactics, Techniques, and Procedures (TTPs) Detection
 - Analytics Automation

Threat Hunting Maturity Model

What can you do with C2?

- Zombie creation
 - Spamming
 - DDoSing
 - Etc.
- Crypto-mining
- Ransomware
- Exfiltration
- ...?
- Usage can depend on the intention:
 - Crimeware
 - Targeted

Tools for C2

- Many tools exist to automate C2 operations
 - Caldera (open & paid)
 - Cobaltstrike (paid)
 - Metasploit (open & paid) 
 - Empire (open)
 - Silver (open)
 - Etc...

- Sample walk through

- Requires Open Office setup to actually do the exploit.
- Uses metasploit functions to see how C2 could work in practice.
- Uses both Kali and Windows VMs

```

msf6 exploit(multi/misc/openoffice_document_macro) > exploit
[*] Exploit running as background job 0.
[*] Exploit completed, but no session was created.

- Look up help for various command and control functions.

```
meterpreter > help
```

Core Commands

Command	Description
?	Help menu
background	Backgrounds the current session
bg	Alias for background
bgkill	Kills a background meterpreter script
bglist	Lists running background scripts
bgrun	Executes a meterpreter script as a background thread
channel	Displays information or control active channels
close	Closes a channel
detach	Detach the meterpreter session (for http/https)
disable_unicode_encoding	Disables encoding of unicode strings
enable_unicode_encoding	Enables encoding of unicode strings
exit	Terminate the meterpreter session
get_timeouts	Get the current session timeout values
guid	Get the session GUID
help	Help menu
info	Displays information about a Post module
irb	Open an interactive Ruby shell on the current session

Examples – Gh0st RAT

- First 5 bytes were used to indicate the C2 commands
- The rest bytes were encoded using zlib compression algorithm
- Different magic headers used
 - HEART
 - cb1st
 - ...
- Typically uses non-standard port (e.g., 1036) so it is reasonably easy to detect.

DLL's Loaded by the Malicious Process:

Examples - Others

- NanoLocker
 - Using ICMP to ping with the ransomware payload
- Zeus
 - Uses P2P protocols
 - XOR'd payload for obfuscation
 - Used UDP payloads
- Blind Drop
 - Used public social media services
 - Could use comments or files such as images, videos, audios etc. to send commands
- Dalexis
 - Used TOR

Defence against C2

- Several techniques exist

Defence against C2

- Several techniques exist
 - Blacklisting (e.g., bad IPs, countries, domains, URLs)
 - Firewalls (block unknown ports/apps)
 - Antimalware to detect C2 malware
 - Inspect/monitor network traffic
 - Detect/block bad SSL certs
 - Deploy anomaly detection
 - Review security policies and logs
